WORLD'S 2ND LARGEST

PAEDIATRIC LIVER TRANSPLANT CENTRE

Healing with *Compassion*

Dr. Rela Institute and Medical Centre, an International medical facility, is a quaternary care hospital dedicated to fostering and responding to the needs of a diverse patient population. The hospital provides highest quality healthcare, as well as access to cutting-edge technology and has experienced, caring medical professionals.

RIMC is designed to provide highly specialised care in all specialities with special focus on care of the critically ill and multi-organ transplantation patients. Established under the leadership of Prof. Mohamed Rela, a world-renowned surgeon in the field of liver surgery and transplantation, this hospital houses one of the worlds largest dedicated liver intensive care units.

A BEACON OF HOPE FOR CHILDREN WITH LIVER DISEASE

CENTRE OF EXCELLENCE FOR PAEDIATRIC LIVER DISEASE AND TRANSPLANTATION

It has been ten years since the inception of Paediatric Liver Transplantation Program at Chennai by Prof. Rela and his team, and over these years what it garnered is beaming smiles on tender faces and trust of numerous. Dr. Rela Institute & Medical Centre hosts one of the largest Liver intensive care in the world.

With more than sixty Paediatric transplants per year, it is the largest Paediatric Liver Transplant Centre in South - Asia. So far more than 600 children had undergone liver transplantation in our Centre. But 600 is not just a number, it is the quantum of hope that has been instilled in these children and their loving families; the hope of better life and a brighter future.

Paediatric Department at Dr. Rela Institute & Medical Centre is specifically designed with state-of-the-art Paediatric and Neonatal Intensive Care, which can take care of Paediatric Multi-Organ Transplants like Liver, Kidney, Small Intestine and Bone Marrow even in small babies. The intensive care team is well supported by transport team who can transfer sick / ventilated babies via land or air.

Why to choose **Rela Hospital** for transplant?

- Liver Transplant Team headed by Prof. Rela, who has over 30 years of experience and has personally done more than 2500 paediatrics transplants
- Dedicated children unit to provide care of paediatric liver that include:
  - Paediatric Intensive Care Unit (PICU)
  - Children Liver Specialist
  - Dedicated Multi-disciplinary Specialist
  - Robotic Donor Hepatectomy

COMMON CHILDHOOD CONDITIONS REQUIRING TRANSPLANT

- **Acute Liver Failure**
- **Chronic Liver Diseases *(Biliary atresia, PFIC, etc)***
- **Metabolic Liver Diseases *(Propionic acidemia, Wilson's Disease, MSUD, etc)***
- **Liver Tumours *(Hepatoblastoma, HCC)***

TYPES OF TRANSPLANT

- **Live Related Donor**
- **Cadaver Transplant *(Split Liver Transplant)***
- **Combined Liver-Kidney Transplant**
- **Auxiliary Liver Transplant**
- **Monosegmental Liver Transplant *(for babies less than 5 kg)***

Paediatric Acute & Critical Care Team (PACT)

Our PACT is trained intensivist driven 24x7 critical care team which handles both 11 bedded General Paediatric Intensive Care Unit and Paediatric Transplant ICU catering to Solid Organ Transplant like Liver, Kidney, Combined Liver Kidney Transplant and Bone Marrow Transplant.

The team is skilled in transport of critically ill children both by land and air transport. Our Scope of Services are Transport of Critically ill Children, Pre-Transplant Stabilization, Advanced Mechanical Ventilation including iNO / HFVO, Extracorporeal Life Support Care such as Continuous Renal Replacement Therapy, Plasmapheresis, ECMO and Procedural Sedation Services.

MBBS, MD (Paediatrics), DM (Paediatric Gastroenterology), (PGIMER, Chandigarh)

Associate Consultant, Paediatric Gastroenterology & Hepatology

Provides comprehensive care for children encountering health issues pertaining to liver, gastrointestinal system, pancreas and also with various nutritional disorders.

Liver Diseases

- Acute Liver Failure
- Acute Hepatitis
- Biliary atresia and other causes of infantile
- Cholestasis
- End Stage Liver Disease
- Metabolic and Genetic Liver Disorders
- Autoimmune Liver Disease
- Vascular disorders of the liver like Budd Chiari Syndrome
- Liver Tumors

Diseases of the GI Tract

The Department is equipped with state of the art endoscopy procedure room

Acute Emergencies

- Foreign Body Ingestion
- Caustic Ingestion
- Variceal Gastro-intestinal (GI) Bleeding

Elective Procedure

- Diagnostic Upper and Lower GI Endoscopy
- Polypectomy

- Paediatric GI diseases
- Constipation
- Chronic abdominal pain
- Chronic diarrhea
- GERD (Gastro Esophageal Reflux Disease)
- IBD (Inflammatory Bowel Disease)
- Intestinal polyps
- Disorders related to pancreas
- Nutritional problems acute and chronic malnutrition, severe acute malnutrition and over-nutrition diseases like childhood obesity and metabolic syndrome
- Intestinal transplant

We are the largest liver transplant centre in India and one of the largest Paediatric Liver Transplant Centre in the world, with more than 100 paediatric liver transplants being done per year.

We provide care to patients during pre, peri and post-transplant period.

Milestones of Prof. Mohamed Rela & Team

Rela Hosp team bags liver transplant award

Chennai: The Transplant Authority of Tamil Nadu presented the Award of Appreciation to Rela Hospital for the best performing live liver transplant team in TN during 2019-20. The award was presented by Health Secretary J Radhakrishnan on the occasion of the 11th Indian Organ Donation Day 2020 on Friday. Dr Naresh Shanmugam, Director of Women and Child Health, Dr Dinesh Jothimani, Director of Hepatology, and Shiva, Manager of Transplant Coordination received the award.

Five-year-old boy undergoes robotic liver transplantation at city hospital

The Hindu Bureau
CHENNAI

A five-year-old boy from Haryana, diagnosed with a rare genetic condition, underwent a robotic liver transplantation at Rela Hospital in Chennai last month.

Doctors from the hospital, speaking at a press conference on Thursday, said that this was a first-of-its-kind procedure involving a paediatric patient and offered two major benefits – a significantly reduced hospital stay, with the boy being discharged on the seventh day after the procedure instead of the usual 14 to 21 days, and minimal scarring unlike in a conventional transplant procedure.

The boy, son of Saurabh Grover and Nikita Kohli from Karnal in Haryana, was diagnosed with a urea cycle defect, a rare genetic condition in which the body is unable to process urea as it should, leading to a build up of ammonia, which is toxic and can affect the brain and other organs.

A liver transplant was necessary, and his mother agreed to donate a portion of her liver, which was also extracted by robotic surgery.

Mohamed Rela, Chairman, Rela Hospital, said that while robotic surgeries had been performed for other conditions, they were not usually used in liver transplantation. However, by using robotic surgery, not only did the child recover quickly, but it was also cost efficient and scar-free. The lack of a large scar, he said, would greatly benefit the patient psychosocially as it would allow him to participate in sports and develop interpersonal relationships like other children his age.

Thanking Dr. Rela and the team at the hospital, Ms. Kohli (who had lost a previous child to the same disorder) said it was a miracle for the family. She said that until last month, her son had not been able to have a normal diet, with food measured constantly and stress over ammonia levels. "By the eighth day after the transplant he was at home, dancing," she said. Rajesh Rajalingam, clinical lead, HPB surgery, and Naresh Shanmugam, senior consultant, paediatric gastroenterology and hepatology of the hospital, also participated.

THE TIMES OF INDIA

Liver transplant using robotic arms gives lease of life to 5-year-old boy

Pooja.Narayan@timesofindia.com

WHAT ARE THE CHALLENGES?

- Children's smaller body cavities and organs create a very cordoned surgical field. This makes it difficult to manoeuver standard-sized robotic arms and instruments without causing damage to surrounding delicate tissues. This can also hinder the precision required for fine dissections
- The carbon dioxide (CO2) gas used to inflate the abdomen during laparoscopic and robotic procedures can have a more significant impact on a child's delicate respiratory and cardiovascular systems

ALL GOOD: Gurkirat with his parents after the surgery

- Paediatric tissues and blood vessels are inherently more delicate and fragile. The lack of direct tactile feedback from robotic instruments increases the risk of inadvertent injury or bleeding
- Performing robotic surgery on children requires extensive specialised training and expertise from the surgical team, beyond what is typically required for adult robotic procedures

Chennai: A five-year-old boy with a rare genetic disorder underwent a successful liver transplant using robotic arms, reducing his recovery time, doctors at Rela Hospital in Chennai said on Thursday.

Gurkirat Grover had a urea cycle defect, a condition that impairs his body's ability to process and remove ammonia, a toxic waste from protein metabolism. Doctors opted for a minimally invasive assisted approach, after which the child was discharged in less than a week, compared to a hospital stay of at least three weeks in traditional open surgery.

"The key to ensuring the youngest recipients of a robotic liver transplant globally," said Dr Naresh Shanmugam, senior consultant, paediatric gastroenterology and hepatology. Due to the genetic condition, his liver did not function properly, he said. "When we eat protein, our bodies break it down into amino acids. During this process, a byproduct called ammonia is naturally produced. The liver enzymes work together in a biochemical pathway to convert the toxic ammonia into a less harmful substance called urea. This urea is then transported through the bloodstream to the kidneys and excreted from the body in urine. With the condition, Grover's body couldn't efficiently convert ammonia into urea," he said.

This led to encephalitis and constant hospitalisations. Grover's parents had lost their precious child due to the same condition. So, when doctors said a liver transplant was a definitive cure, they instantly agreed. His mother Nikita Kohli, was the donor.

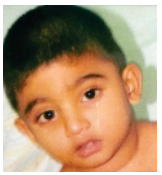
Doctors opted for robotic transplants to prevent complications. The donor liver was removed using robotic arms, too. In the patient, the surgical cut was less than 6cm under the belly button, compared to the 12cm cut on the belly during conventional surgery.

"It's easy on the child as it reduces blood loss, complications, and expedites recovery," said hospital chairman Dr Mohamed Rela. "But for a surgeon, paediatric bodies offer far less space than adults. We create more working space inside the abdomen. So, it posed greater challenges for the insertion and manoeuvring of robotic instruments," he explained. Additionally, doctors opted for an auxiliary liver transplant, where only a portion of a healthy donor liver is implanted into the recipient. Part of the recipient's original diseased liver was left in place.

RELA **CARE**

Peace be upon you and your team. We really know little words to express our gratitude. For us you are the blessed light house of hope. And it is you and your team who drop us to the shore of happiness. We pray for you consistent success in life. Let your dream, mission and vision come true.

P/o NKM Meehup Sahaik



Just wanted to let you know how much your care and attention is appreciated. Thanks for helping us through a difficult time.

Mr Prasada Peiris & Ms Lakshmi Perisi
P/o Baby Methamina Perisi

Without the Organ Donor there is no story, no hope, no transplant. But when there is an Organ Donor, Life springs from death, Sorrows turns to hope and the terrible loss becomes a Gift.
Thank you to all the Doctors for my treatment. The caring staff members and the relief I experienced.

Ms. Reem Thota, Manipal

My eyes are now clear because I have my papa's liver in my tummy.

Batool Hassan, Karachi, Pakistan
(The first ever Pakistani child to undergo transplantation in India)

Life has come a full circle for Razi from being a bubbly energetic playful kid, he slipped into a period of pain and somber - leaving the whole family in a poignant state.
Post his successful surgery and the whole hearted support of the doctors and staff of Rela Hospital, he is back to his real self our bubbly and naughty son.

Mohammed Razi, Kerala

All the docters of rela hospital including Dr. Rela and his team and Dr. Naresh and his team are a god for us Dr. Rela Hospital is a temple for us We will always worship it. A heartfelt thanks you to Dr. Rela for giving our 2 month old son a happy and new life not only to our baby they have bought new life to both us.

Siwansh, Nepal

Avya had already undergone 3 surgeries in her first 3 month of her life and when we got to know that she has Billary atresia the only way out is a liver transplant so we came to Dr. Rela Institute for there procedure Our decision was absolutely right as she got a good treatment here the doctors here are really dedicated and very cooperative. I would want to thank the team of Dr. Naresh (hepatology), Dr. Ravi (PICU) and Prof. Rela (Surgery) for their continuos help and support. May god bless you and you help more and more needy people.

Avya, New Delhi

Words are not enough to express our happiness and gratitude, Thanks you for the miracle you bought in my life. Everyday of my life will be better because of you.
Thank you for the above and beyond follow up service that we are receiving before and after surgery. Countless Thanks to the entire transplant team.

THE LIVER TRANSPLANT PROCESS AT **RIMC**

The patient and the family would be seen and counseled by multi-disciplinary team consist of Paediatric hepatologist, transplant surgeon, anesthetist and transplant coordinator.

Recipient evaluation consist of blood test, CT scan of liver, ECHO cardiograms and specialist consult (if needed). Donor should be between 18 and 50 years of age with BMI<30 and no co-morbid illness like diabetes, hypertension, etc. Donor would undergo blood test, CT and MRI scan of liver and would be seen by specialists like cardiologist, pulmonologist, etc. to make sure they do not have any co-morbid illness.

Once evaluation is completed the donor and recipient would be discussed in multi-disciplinary transplant meeting and then clearance is given. Some cases might require special clearance from Government. Once the whole process is complete the patient would be posted for liver transplant.

Frequently Asked Questions

Do my children require liver transplant? How to contact Rela Hospital?
You can mail your quires to info@relainstitute.com or call +91 - 80561 22134. Our experts will help you.

How can I get an appointment with the paediatric liver team or Prof. Mohamed Rela?
You can call +91 - 80561 22134 or Mr. Srikanth +91 - 98840 00104

My child has jaundice does he require liver transplantation?
Jaundice is only an external manifestation of liver problem. We need to assess the underlying problem and if feasible, we can treat with medication. If your child don't have medical treatment or liver damage is advanced, then liver transplantation is needed.

Is there a minimum age or weight for liver transplantation?
No, even new born babies could undergo transplantations.

How long my child has to stay in hospital?
Usually children stay for 2 to 3 weeks post liver transplantation.

Will my child have normal life?
Yes, your child will have normal life like any other child by attending school and participating in sports.

How can I travel to Chennai and arrange accommodation?
Visit our website www.relainstitute.com

Will there be any helpdesk that can help me with the travel?
Yes, you can call +91 - 80561 22134
